Operating System Info, Window, Linux, MacOS installation and adjust OS Settings

1. **On your Windows laptop or PC, open 'System Information' and take a screenshot showing your OS version, processor, and RAM details**

2. Download any official Linux distribution ISO (like Ubuntu or Fedora), and use Rufus or BalenaEtcher to create a bootable USB drive for installation.

Hint: If you don't have a spare USB, use a virtual machine tool like VirtualBox to mount the ISO and start the installation process virtually.

Procedure:

1. Download Ubuntu ISO: Visit the official Ubuntu website: https://ubuntu.com/download/desktop and download the latest Ubuntu Desktop ISO file.

2. Download Rufus: Visit https://rufus.ie and download Rufus on a Windows computer.

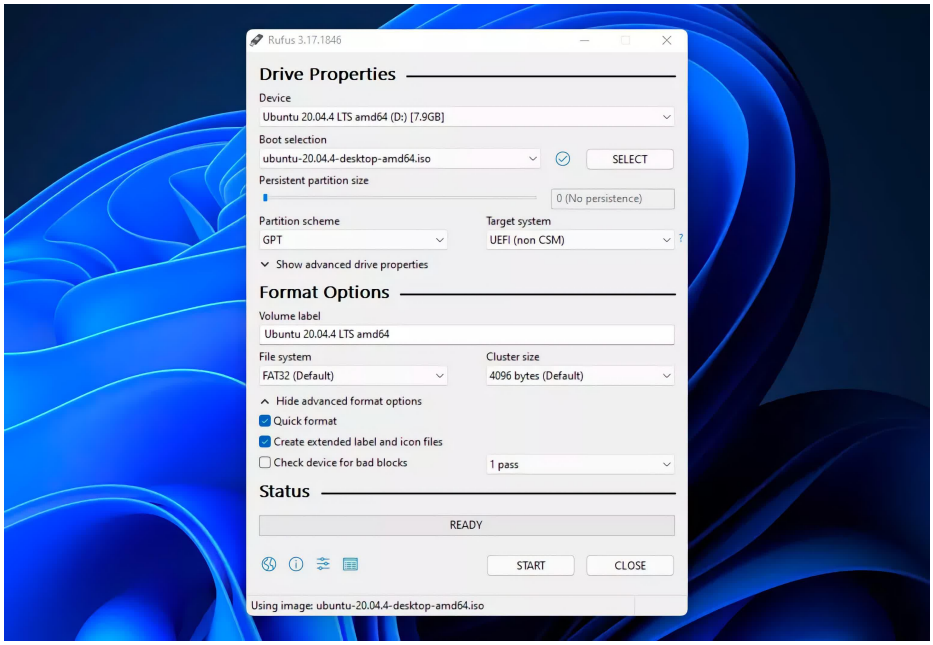

3. Insert USB drive: Connect a USB drive (minimum 8 GB recommended) to the computer. Make sure there is no important data on it because the process will erase its contents.

4. Open Rufus: Launch Rufus and select the connected USB drive under the Device option.

5. Select ISO file: Click SELECT and choose the downloaded Ubuntu ISO file.

6. Create bootable USB: Keep the recommended settings, select START, and wait until Rufus completes the process.

7. Verify: Once the process is complete, safely eject the USB drive. It is now ready to boot and

Alternative method (VirtualBox):

If a spare USB drive is not available, I can install Oracle VirtualBox, create a new virtual machine, select Linux as the operating system, and attach the downloaded Ubuntu ISO file as a virtual optical disk. Then I can start the virtual machine and follow the Ubuntu installation instructions without changing my existing Windows installation.

Conclusion: I learned how to download an official Linux ISO and create a bootable USB drive using Rufus. Alternatively, VirtualBox allows me to install and explore Linux in a virtual environment without needing a physical USB drive.

3. On a macOS device (or using a macOS virtual machine), open 'System Preferences' and change the desktop wallpaper, then adjust the system language to Hindi or Gujarati.

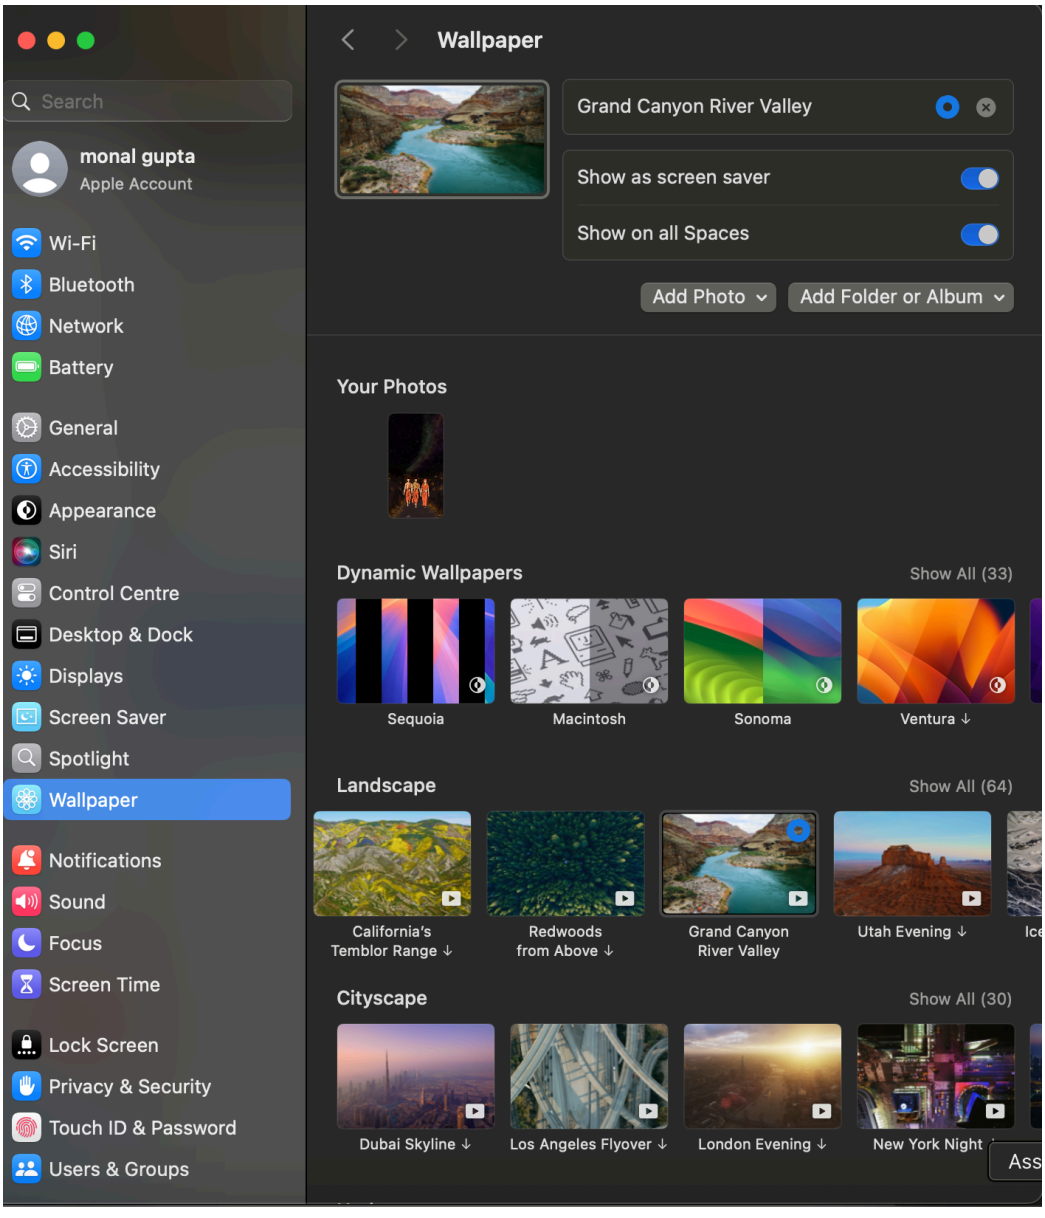

Hint: Find 'Language & Region' in System Preferences to add or change languages.

Aim: To change the desktop wallpaper and modify the system language to Hindi or Gujarati on a macOS device.

Procedure:

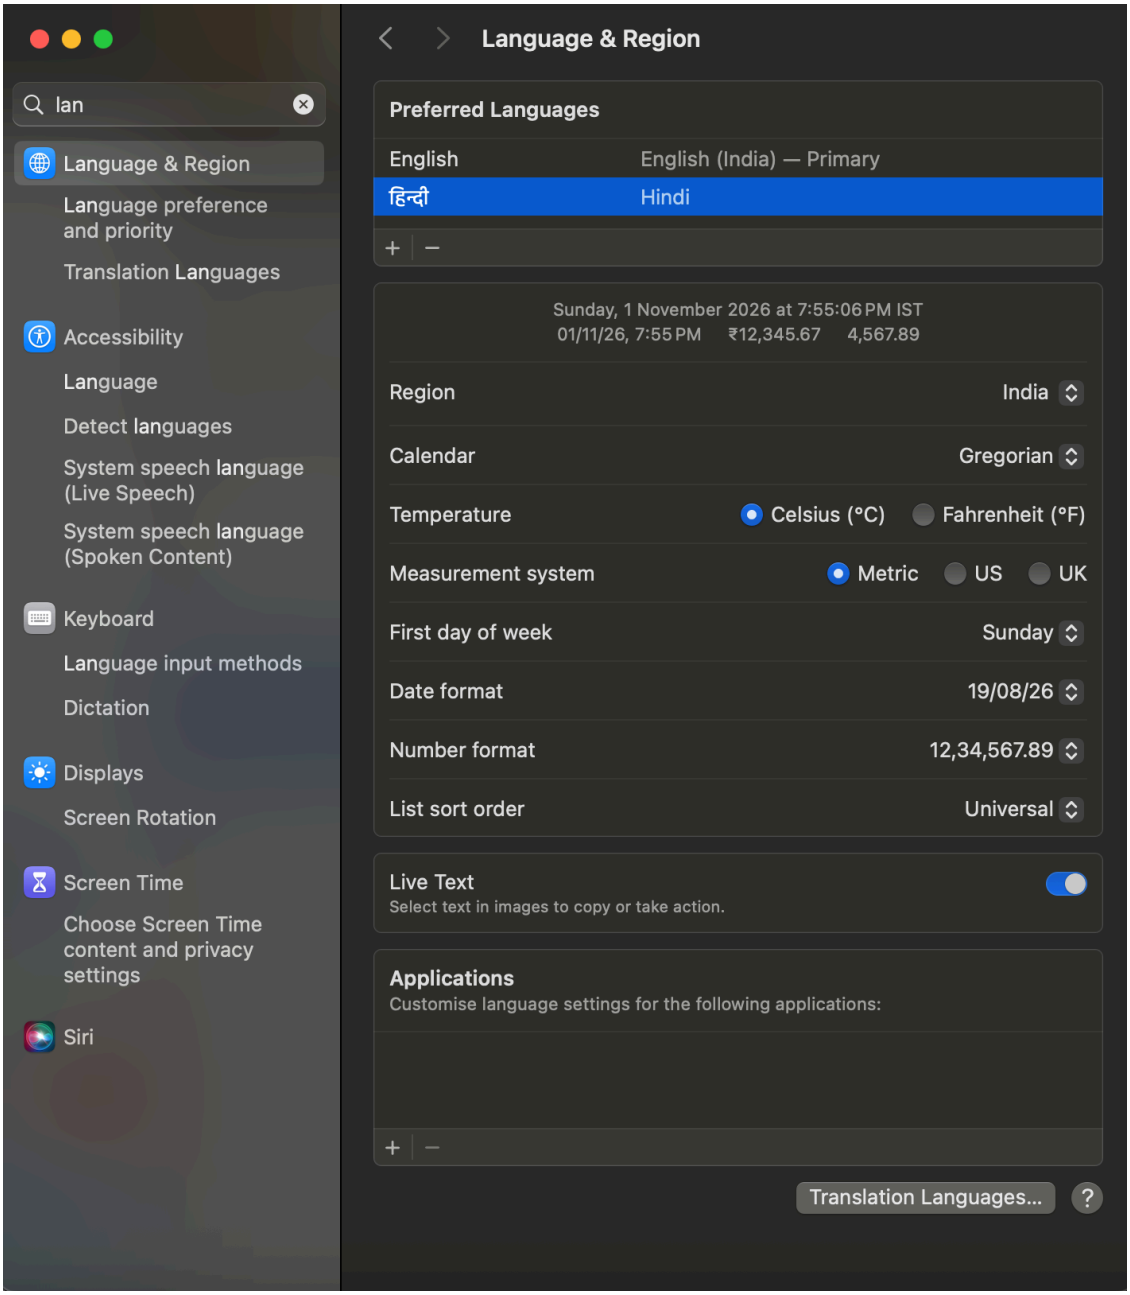

1. Change Desktop Wallpaper

1. Open the Apple menu at the top-left corner of the screen.
2. Select System Settings.
3. Click on Wallpaper.
4. Choose a wallpaper from the available images.
5. Click on the selected image to apply it as the desktop background.

2. Change System Language

1. Open the Apple menu and select System Settings.
2. Click on Language & Region.
3. Click the + (Add) button under Preferred Languages.
4. Select Hindi or Gujarati from the language list.
5. Click Add.
6. Choose the newly added language as the primary language if prompted.
7. Restart the Mac or log out and log in again if required to apply the changes.

4.Install a fresh copy of Ubuntu Linux (real or virtual machine) and create a new user account named 'gamer'. After installation, enable automatic login for this user and take a screenshot of the login screen showing the username.

Aim: To install Ubuntu Linux, create a new user account named `gamer`, enable automatic login, and verify the settings.

Procedure

1. Install Ubuntu Linux

1. Download the Ubuntu ISO file from the official website: https://ubuntu.com/download/desktop
2. Open VirtualBox and create a new virtual machine.
3. Select Linux as the operating system and Ubuntu (64-bit) as the version.
4. Allocate RAM and storage space.
5. Attach the downloaded Ubuntu ISO file and start the virtual machine.
6. Follow the installation instructions to install Ubuntu

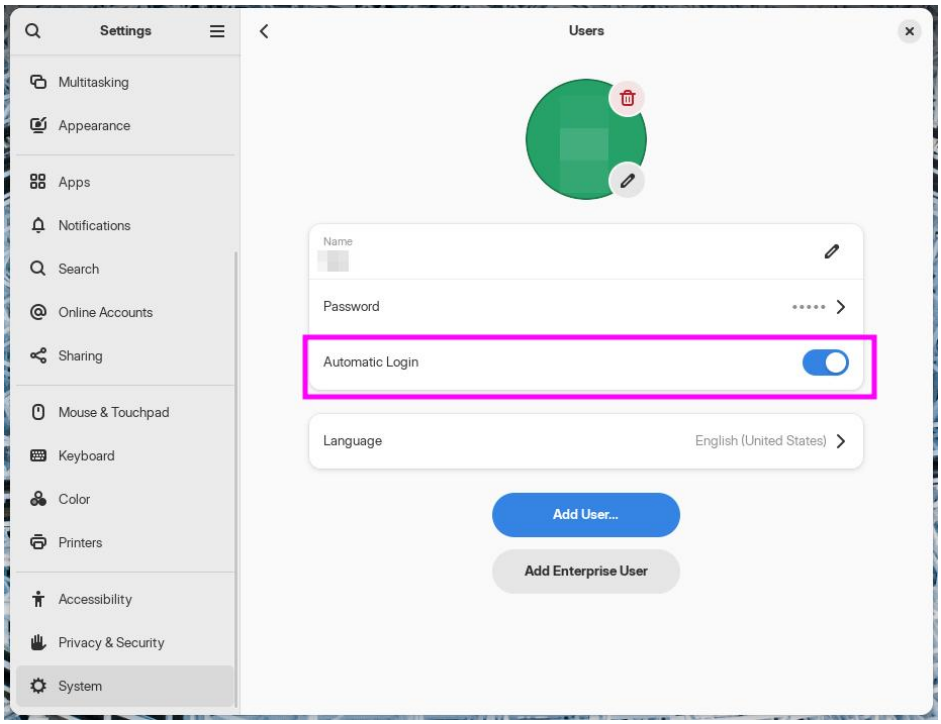

2. Create a New User Account

1. Open Ubuntu Settings.
2. Go to System → Users (or Users, depending on the Ubuntu version).
3. Click Unlock and enter the administrator password.
4. Select Add User.
5. Enter the following details:
    - Full Name: Gamer
    - Username: gamer
    - Account Type: Standard
    - Password: Set a password.
6. Click Add to create the account

3. Enable Automatic Login

1. Open Settings → System → Users.
2. Unlock the settings using the administrator password.
3. Select the `gamer` account.
4. Enable the Automatic Login option.

5. Restart Ubuntu to verify that it logs in automatically as gamer.

4. Verify the User Account

- Restart the Ubuntu virtual machine.
- Check that Ubuntu automatically opens the desktop without asking for a password.

5. Use ChatGPT to generate a step-by-step guide for installing Windows 10 on a laptop, including partitioning tips and post-installation settings for privacy and updates. Follow the guide and note any steps that were unclear or missing.

Practical: Step-by-Step Guide to Installing Windows 10 on a Laptop

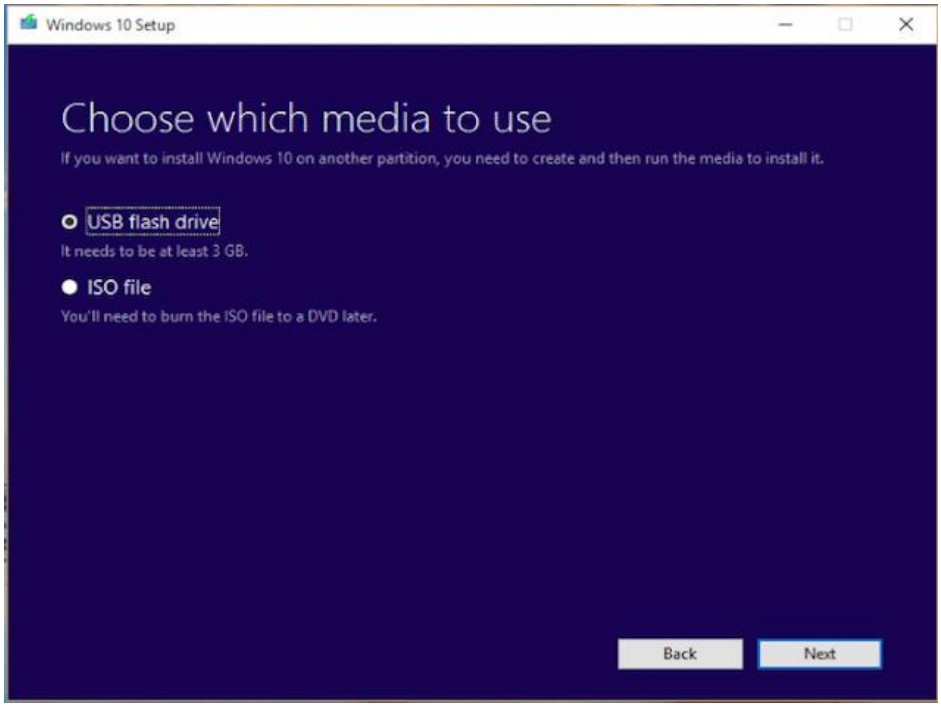

Aim: To understand how to install Windows 10 on a laptop, create and manage disk partitions, and configure privacy and Windows Update settings after installation.

Important note: Windows 10 reached the end of standard support on 14 October 2025. Since it is now 2026, it is better to install Windows 11 if your laptop supports it. If Windows 10 is specifically required for this practical, check Microsoft's Extended Security Updates (ESU) eligibility.

Part 1: Requirements before installation

Before starting, arrange the following:

1. Laptop with a working keyboard and display.
2. USB drive (minimum 8 GB).
3. Windows 10 ISO file.
4. Rufus tool or Microsoft's Media Creation Tool.
5. Internet connection.
6. Backup of important files.

Safety precaution: Back up all important files before installation because formatting or deleting partitions can permanently erase data.

Part 2: Download Windows 10

1. Visit Microsoft's official Windows 10 download page.
2. Download the Windows 10 installation media.
3. Create a bootable USB drive using the Media Creation Tool or Rufus.
4. Insert the USB drive into the laptop.
5. Restart the laptop and open the Boot Menu (commonly F12, F9, F10 or Esc, depending on the manufacturer).
6. Select the USB drive to start Windows installation.

Part 3: Windows installation and partitioning

1. Select your preferred language, time format and keyboard layout.
2. Click Install Now.
3. Enter your Windows product key, or select I don't have a product key if you have a valid digital licence.
4. Select the correct Windows edition for your licence.
5. Accept the licence terms.
6. Select Custom: Install Windows only (advanced).

Partitioning tips:

When the disk partition screen appears, you can create or select partitions.

- C Drive: Use this for Windows and installed applications. A practical size is around 150–200 GB if sufficient storage is available.
- D Drive: Use this for personal files, documents, videos and other data.
- System partitions: Windows automatically creates small EFI, recovery and reserved partitions. Do not delete these unnecessarily.

For a clean installation on a new or fully backed-up drive, you can delete existing partitions on the intended installation disk and select the resulting unallocated space. Windows will create the required system partitions automatically.

Important
Never delete partitions unless you are certain they belong to the intended installation drive. If you want to retain existing files or another operating system, stop and plan the partition layout first.

7. Select the intended Windows partition and click Next.
8. Wait for Windows to copy files and complete installation.
9. The laptop will restart several times.

Part 4: Initial Windows settings

After installation, Windows will ask you to configure some basic settings.

1. Select your country or region.
2. Choose your keyboard layout.
3. Connect to a Wi-Fi network if available.
4. Create or sign in to a user account.
5. Set a password or PIN.
6. Review the privacy options before accepting them.

Part 5: Configure privacy settings

After reaching the desktop:

1. Open Settings → Privacy.
2. Review the following settings:

Setting	Recommended action
Location	Turn off if not required
Camera	Allow access only to necessary apps
Microphone	Allow access only to necessary apps
Diagnostics & feedback	Choose the minimum available diagnostic data
Activity history	Disable if not needed
Advertising ID	Turn off
Background apps	Disable unnecessary apps

These settings help reduce unnecessary sharing of personal information and control application permissions.

Part 6: Configure Windows updates

1. Open Settings → Update & Security → Windows Update.
2. Click Check for updates.

3. Install all available updates applicable to your Windows installation.
4. Restart the laptop if requested.
5. Check Device Manager to verify that essential drivers, such as Wi-Fi, audio and graphics, are working.

   Windows 10 security warning: Installing ordinary Windows 10 updates alone does not restore full support. Eligible Windows 10 22H2 devices can enrol in Microsoft's Consumer Extended Security Updates programme, which provides critical and important security updates until 12 October 2027.

Part 7: Final verification

After completing installation, I would check:

- Windows starts successfully.
- Desktop and Start Menu are working.
- Wi-Fi and Bluetooth are connected.
- Keyboard, touchpad and speakers are functioning.
- Disk partitions are visible in File Explorer.
- Privacy settings have been reviewed.
- Windows activation status is checked under Settings → Update & Security → Activation.

Part 8: Observation – Steps that were unclear or missing

After reviewing the installation procedure, I identified the following points that needed additional clarification.

Step	What was unclear or missing
Boot Menu	The key to open the Boot Menu differs between laptop manufacturers.
Product key	It was unclear whether a product key is compulsory during installation.
Partitioning	The exact partition sizes depend on available disk space and personal requirements.
Drivers	Some laptops may require drivers to be installed manually.
Privacy	Some privacy options may differ depending on the Windows edition.
Updates	Windows 10 support has ended, so ordinary updates are not sufficient for continued security.

Conclusion

With the help of ChatGPT, I learned the complete process of installing Windows 10, creating disk partitions, configuring privacy settings and checking for updates. I also understood the importance of backing up data before installation and checking hardware compatibility.
